BIORISK GLOSSARY

The definitions used in this exercise are from the World Health Organization's, *Responsible Life Science for Global Health Security: A Guidance Document*. 2010;
http://whqlibdoc.who.int/hq/2010/WHO_HSE_GAR_BDP_2010.2_eng.pdf

Subset of Definitions from WHO

“Bioethics: The study of the ethical and moral implications of biological discoveries, biomedical advances and their applications, as in the fields of genetic engineering and drug research.”

“Biorisk: The risk (risk is a function of likelihood and consequences) that a particular biological event (in the context of this document: naturally occurring diseases, accidents, unexpected discovery, or deliberate misuse of biological agents and toxins), which may affect adversely the health of human populations, may occur. An assessment of these risks can be both quantitative and qualitative.”

“Biorisk reduction: The reduction of the occurrence of risks associated with exposure to biological agents and toxins, whatever their origin or source, encompassing the full spectrum of biorisks.”

“Laboratory biosafety: The containment principles, technologies and practices that are implemented to prevent unintentional exposure to biological agents and toxins, or their accidental release.”

“Laboratory biosecurity: The protection, control and accountability for valuable biological materials within laboratories, in order to prevent their unauthorized access, loss, theft, misuse, diversion or intentional release.”

“Dual-use life sciences research: Knowledge and technologies generated by legitimate life sciences research that may be appropriated for illegitimate intentions and applications.”

“Research excellence: Research that is of high quality, ethical, rigorous, original and innovative.”

Additional Definitions

The definitions below are from the *U.S. National Academy of Sciences (2009) On Being a Scientist: A Guide to Responsible Conduct of Research: Third Edition*.

Research Misconduct: “Fabrication, falsification, or plagiarism in proposing, performing, or reviewing research or in reporting research results.”

Falsification: “Manipulating research materials, equipment, or processes, or changing or omitting data or results such that research is not accurately represented in the research record.”

Fabrication: “making up data or results”

Plagiarism: the use “of another person’s ideas, processes, results, or works with our giving appropriate credit.”

Protection of Human Subjects: “Protect the interest of research Subjects” by ensuring “that risks to human participants are minimized; that risks are reasonable given the expected benefits; that the participants or their authorized representatives provide informed consent; that the investigator has informed participants of key elements of the study protocol; and that the privacy of participants and confidentiality of data are maintained.”

Animal Subject Care and Use: “to establish and maintain proper measures to ensure the appropriate care and use of all animals involved in research, research training, and biological testing.” Researchers should consider “reduction in the numbers of animals used, refinement of techniques and procedures to reduce pain and distress, and replacement of conscious living higher animals with insentient material.”

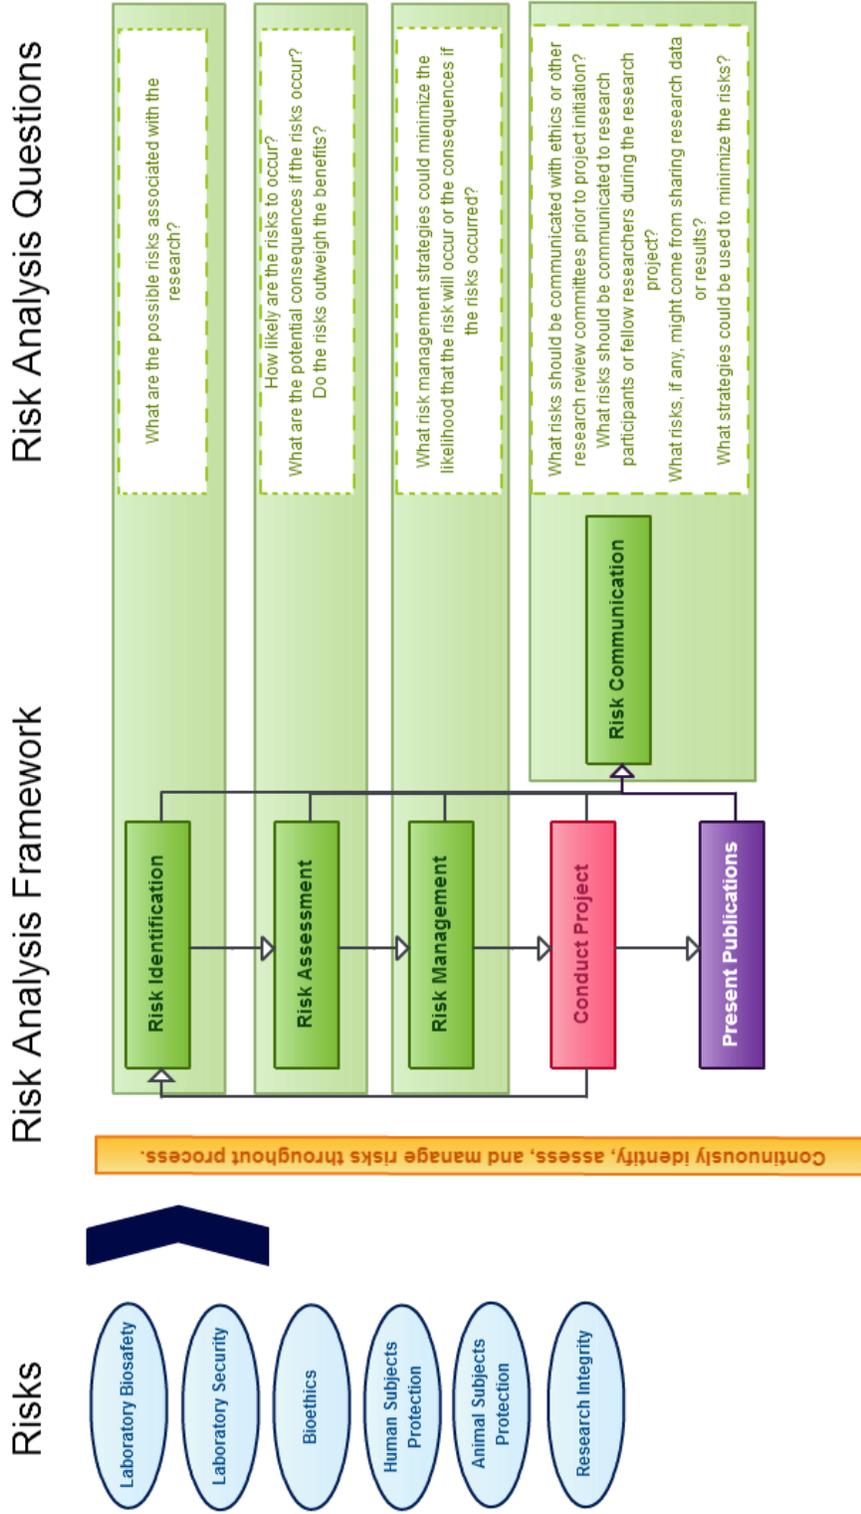

Negligence: “Haste, carelessness, inattention – any of a number of faults can lead to work that does not meet scientific standards or the practices of a discipline.”

The definitions below are from the *U.S. National Academy of Sciences (1992) Responsible Science, Volume I: Ensuring the Integrity of the Research Process*.

Research Integrity: “the adherence by scientists and their institutions to honest and verifiable methods in proposing, performing, evaluating, and reporting research activities.

Research Process: “the construction of hypotheses; the development of experimental and theoretical paradigms; the collection, analysis, and handling of data; the generation of new ideas, findings, and theories through experimentation and analysis; timely communication and publication; refinement of results through replication and extension of the original work; peer review; and the training and supervision of associates and students.

RISK ANALYSIS FRAMEWORK

RISK IDENTIFICATION

Questions	Answers
<p>What, if any, are the potential safety risks to research staff? (Consider: clinical and environmental sample collection, transport, and laboratory testing)</p> <p>What, if any, security risks are posed by collecting, transporting, and testing contaminated samples?</p>	
<p>What, if any, are the risks associated with potentially antibiotic resistant bacteria?</p>	
<p>What, if any, are the potential risks or concerns associated with working with non-academic or governmental partners such as a local NGO? Could the partner's behavior put the research, researchers, or participants at risk in any way?</p>	
<p>What, if any, risks are associated with enrolling people from remote villages who are affected by a devastating disease? What, if any, social or cultural risks might be associated with enrollment in the study?</p>	
<p>What, if any, are the risks posed by conducting research in response to a rapid crisis event, such as this typhoid outbreak, where the researcher does not have the opportunity to deliberately select and screen participants?</p>	

RISK ASSESSMENT

Question	Answers
<p>What, if any, are the potential safety risks to research staff? (Consider: clinical and environmental sample collection, transport, and laboratory testing)</p> <p>What, if any, security risks are posed by collecting, transporting, and testing contaminated samples?</p>	
<p>What, if any, are the risks associated with potentially antibiotic resistant bacteria?</p>	
<p>What, if any, are the potential risks or concerns associated with working with non-academic or governmental partners such as a local NGO? Could the partner's behavior put the research, researchers, or participants at risk in any way?</p>	
<p>What, if any, risks are associated with enrolling people from remote villages who are affected by a devastating disease? What, if any, social or cultural risks might be associated with enrollment in the study?</p>	
<p>What, if any, are the risks posed by conducting research in response to a rapid crisis event, such as this typhoid outbreak, where the researcher does not have the opportunity to deliberately select and screen participants?</p>	

RISK MANAGEMENT

Question	Answers
How could researchers in this or a similar project minimize possible biosafety and biosecurity risks without changing the scientific question or quality?	
What approaches, if any, could minimize any of the identified risks associated with the epidemiology study?	
What strategies can you use to minimize the risks from working with outside partners? In addition to being a source of risk, can having outside NGO partners be a strategy to reduce risks? If so, how?	
What, if any, are the specialized competencies, skills, and training needed to carry out this epidemiological study?	
Researchers were unable to collect samples from healthy individuals, who would have served as the study control. What strategies, if any, could the researchers use to better engage the community to improve the experimental analyses and study results?	

RISK COMMUNICATION

Question	Answers
<p>What are the risks that should be communicated during this research? To whom?</p>	
<p>What information is needed to communicate the risks and risk mitigation approaches to institutional review boards or ethics committees prior to initiation of the epidemiology study? What, if any, challenges are associated with having to provide the information in a very short time scale?</p>	
<p>What steps could be taken to de-identify data and make it anonymous before it is shared with other researchers during the study, at conferences, or upon publication?</p>	
<p>What strategies could be used to communicate findings and recommendations with the typhoid-affected community and other stakeholders to prevent similar outbreaks in the future?</p>	
<p>What, if any, biosafety and biosecurity risks are associated with communicating the study results in open literature? Do the risks change with results describing multidrug resistant bacteria in an unprotected area?</p>	
<p>What are the risks that should be communicated during this research? To whom?</p>	

FINAL EXERCISE

1. Identification: What are the primary risks you face in your research? Think about the risks to you and other researchers and technicians in the field, clinic, and/or lab, the general public, the environment and economy, your institution, and human and animal subjects.

2. Assessment: What are the consequences of the identified risks if they occur? How likely are they to occur? Based on your assessment of the potential consequences, are there any risks that could harm people, animals, crops, or the economy?

What resources, capabilities, and skills are needed to mitigate these risks?

3. Management: What strategies could you use or resources you could refer to minimize or mitigate these risks? (These strategies should not decrease the quality of the research.) For ideas of possible strategies and resources, consider those discussed in this practical exercise and from your own experiences.

Are there any risks associated with your research that cannot be adequately mitigated?

4. Communication: What risks, if any, are associated with communicating your research during the design or conduct of the research? What risks, if any, are associated with communicating the research results at scientific conferences and in publications? What strategies could you use to mitigate the risks? Are there any stakeholders with whom you must share or should share the risks of your research? Your findings?
